Diagonal 5.7 mm (Type 1/3.2) CMOS Image Sensor with Square Pixel for Color Cameras

# IMX179QQH5-C

#### **Description**

The IMX179 is a diagonal 5.7 mm (Type 1/3.2) CMOS active pixel type image sensor with a square pixel array and 8.08M effective pixels. This chip operates with three power supplies, analogue 2.7 V, digital 1.2 V, and IF 1.8 V, and has low power consumption. High sensitivity, low dark current, and no smear are achieved through the adoption of R, G, and B primary color pigment mosaic filters. This chip features an electronic shutter with variable charge-storage time.

In addition, this product is designed for use in cellular phone and tablet PC. When using this for another application, Sony does not guarantee the quality and reliability of product.

Therefore, don't use this for applications other than cellular phone and tablet PC. Consult your Sony sales representative if you have any questions.

#### **Features**

- ◆ CMOS active pixel type dots
- ◆2-wire serial communication circuit on chip
- CSI2 serial data output
- Timing generator, H and V driver circuits on chip
- ◆ CDS/PGA on chip
- ◆ 10-bit A/D converter on chip
- ◆ Automatic optical black (OB) clamp circuit on chip
- ◆ PLL on chip (rectangular wave/sine wave)
- High sensitivity, low dark current, no smear
- ◆ Excellent anti-blooming characteristics
- ◆ Variable-speed shutter function (1H units)
- R, G, B primary color pigment mosaic filters on chip
- ◆ Max. 30 frame/s in all-pixel scan mode
- ◆ Pixel rate: >260 MHz (>30 frame/s at All-pixel mode)

ExmorR

"Exmor R" is a trademark of Sony Corporation. The "Exmor R" is a Sony's CMOS image sensor with significantly enhanced imaging characteristics including sensitivity and low noise by changing fundamental structure of "Exmor" pixel adopted column parallel A/D converter to back-illuminated type.

#### **USE RESTRICTION NOTICE**

This USE RESTRICTION NOTICE ("Notice") is for customers who are considering or currently using the image sensor products ("Products") set forth in this specifications book. Sony Corporation ("Sony") may, at any time, modify this Notice which will be available to you in the latest specifications book for the Products. You should abide by the latest version of this Notice. If a Sony subsidiary or distributor has its own use restriction notice on the Products, such a use restriction notice will additionally apply between you and the subsidiary or distributor. You should consult a sales representative of the subsidiary or distributor of Sony on such a use restriction notice when you consider using the Products.

#### **Use Restrictions**

- The Products are intended for incorporation into such general electronic equipment as office products, communication products, measurement products, and home electronics products in accordance with the terms and conditions set forth in this specifications book and otherwise notified by Sony from time to time.
- You should not use the Products for critical applications which may pose a life- or injury-threatening
  risk or are highly likely to cause significant property damage in the event of failure of the Products. You
  should consult your sales representative beforehand when you consider using the Products for such
  critical applications. In addition, you should not use the Products in weapon or military equipment.
- Sony disclaims and does not assume any liability and damages arising out of misuse, improper use, modification, use of the Products for the above-mentioned critical applications, weapon and military equipment, or any deviation from the requirements set forth in this specifications book.

#### **Design for Safety**

Sony is making continuous efforts to further improve the quality and reliability of the Products; however, failure of a certain percentage of the Products is inevitable. Therefore, you should take sufficient care to ensure the safe design of your products such as component redundancy, anti-conflagration features, and features to prevent mis-operation in order to avoid accidents resulting in injury or death, fire or other social damage as a result of such failure.

#### **Export Control**

 If the Products are controlled items under the export control laws or regulations of various countries, approval may be required for the export of the Products under the said laws or regulations.
 You should be responsible for compliance with the said laws or regulations.

#### No License Implied

• The technical information shown in this specifications book is for your reference purposes only. The availability of this specifications book shall not be construed as giving any indication that Sony and its licensors will license any intellectual property rights in such information by any implication or otherwise. Sony will not assume responsibility for any problems in connection with your use of such information or for any infringement of third-party rights due to the same. It is therefore your sole legal and financial responsibility to resolve any such problems and infringement.

#### Governing Law

This Notice shall be governed by and construed in accordance with the laws of Japan, without reference
to principles of conflict of laws or choice of laws. All controversies and disputes arising out of or relating
to this Notice shall be submitted to the exclusive jurisdiction of the Tokyo District Court in Japan as the
court of first instance.

#### Other Applicable Terms and Conditions

The terms and conditions in the Sony additional specifications, which will be made available to you when
you order the Products, shall also be applicable to your use of the Products as well as to this
specifications book. You should review those terms and conditions when you consider purchasing
and/or using the Products.

#### 2. Pixel Signal Output Specifications

IMX179 has CSI-2 interface and the options are 2 lanes or 4 lanes.

#### 2-1 CSI-2 Signalling Mode

#### 2-1.1 MIPI Transmitter

Output pins (DMO1P/DMO1N, DMO2P/DMO2N, DCKP/DCKN,) of CSI-2 are shown below

Fig. 4 Relationship between Output pin name and Mipi output Lane

Data and clock signals are transmitted using CSI-2 interface (high speed serial interface). Detailed explanation of CSI-2 interface is in following two documents, "MIPI Alliance Standard for Camera Serial Interface2 (CSI-2) Version 1.00" and "MIPI Alliance Specification for D-PHYVersion 0.90.00". In CSI-2 interface, one bit of data is transmitted by a pair of differential signals. In the transmitter of CSI-2 interface, differential digital signals of data or clock are converted to differential current signals. At the receiver of CSI-2 interface, inserting output resistance, which is serial to a pair of differential outputs (data or clock), or connecting the receiver block, which includes internal resistance for a pair of differential outputs (data or clock), is required. In the case of using output resistance, output resistance is placed close to the receiver. Additionally, it is recommended that each space between differential output lines such as DMO1P/DMO1N, DMO2P/DMO2N, or DCKP/DCKN is identical, the length of all differential output lines is same, and output line length between the transmitter and the receiver is minimum.

#### 2-1.2 Output Lane

Two or Four data output Lanes are applied from MIPI Alliance Standard for Camera Serial Interface2 (CSI-2) Version 1.00.

#### 2-1.2.1 2Lane Output

Outputs of data and clock come from CSI-2 output pins (DMO1P/DMO1N, DMO2P/DMO2N, DCKP/DCKN). A pair of DMO1P/DMO1N is called Lane1 data and a pair of DMO2P/DMO2N is called Lane2 data. Also, clock signals come from CSI-2 output pins, DCKP/DCKN. Maximum output data rate is 750 Mbps/lane. For 2Lane output, following register settings are required (1lane output is not supported).

1	Index	Bit	Register Name	RW	Comment	Default	Desired
	0x0309	[3:0]	OPPXCK_DIV	RW	op_pix_clk_div	0x05	0x0A
	0x3364	[1:0]	CSI_LANE_MODE	RW	CSI_lane_mode 0: 4 lane, 2: 2lane,	0x00	0x02

#### 3. Control Registers

The IMX179 can use the 2-wire serial communication method for sensor control. These specifications are described for sensor control using the 2-wire serial communication as follows.

#### 3-1 2-wire Serial Communication Operation Specifications

The 2-wire serial communication method conforms to the Camera Control Instance (CCI). CCI is an I<sup>2</sup>C fast-mode compatible interface, and the data transfer protocol is I<sup>2</sup>C standard.

This 2-wire serial communication circuit can be used to access the control-registers and status-registers of IMX179.

Fig. 5 2-wire Serial Communication

Table. 3 Description of 2-wire Serial Communication Pins

Symbol	Description
SDA	Serial data communication
SCL	Serial clock input

#### 3-1.1 Communication protocol

2-wire serial communication supports a 16-bit register address and 8-bit data message type.

Fig. 6 2-wire Serial Communication protocol

Data is transferred serially, MSB first in 8-bit units. After each data byte is transferred,

A (Acknowledge)/ $\bar{A}$  (NegativeAcknowledge) is transferred. Data (SDA) is transferred at the clock (SCL) cycle.

SDA can change only while SCL is Low, so the SDA value must be held while SCL is High.

The Start condition is defined by SDA changing from High to Low while SCL is High. When the Stop condition is not generated in the previous communication phase and Start condition for the next communication is generated, that Start condition is recognized as a Repeated Start condition.

Fig. 7 Start Condition

Fig. 8 Repeated Start Condition

The Stop condition is defined by SDA changing from Low to High while SCL is High.

Fig. 9 Stop Condition

The slave address is as follows.

Fig. 10 Slave Address (Default)

The R/W bit indicates the data transfer direction.

Table. 4 R/W Bit

R/W bit	Transfer direction
0	Write (Master →Sensor)
1	Read (Sensor → Master)

After transfer of each data byte, the Master or the sensor transmits an Acknowledge / Negative Acknowledge and releases (does not drive) SDA. When Negative Acknowledge is generated, the Master must immediately generate the Stop condition and end the communication.

Fig. 11 Acknowledge and Negative Acknowledge

The registers have a 16-bit address space, and are assigned as follows.

Table. 5 2-wire Serial Communication Address Space

Address area	Description
0x0000 - 0x0FFF	Configuration register
0x1000 - 0x1FFF	Parameter limit register Read Only and Static register
0x2000 - 0x2FFF	Image statistics register
0x3000 - 0x3FFF	Manufacture specific register

#### 3-1.2 2-wire serial communication read/write operation supported by the IMX179

The IMX179 supports the following four read operations and two write operations that conform to the SMIA standard

Table. 6 Operations Supported by 2-wire Serial Communication

1	CCI Single read from random location (Single read from an optional address)
2	CCI Single read from current location (Single read from the held address)
3	CCI sequential read starting from random location (Sequential read starting from an optional address)
4	CCI sequential read starting from current location (Sequential read starting from the held address)
5	CCI single write to random location (Single write to an optional address)
6	CCI sequential write starting from random location (Sequential write starting from an optional address)

#### 3-1.2.1 CCI single read from random location

The sensor has an index function that indicates which address it is focusing on. In reading the data at an optional single address, the Master must set the index value to the address to be read. For this purpose it performs dummy write operation up to the register address. The upper level of the figure below shows the sensor internal index value, and the lower level of the figure shows the SDA I/O data flow. The Master sets the sensor index value to M by designating the sensor slave address with a write request, then designating the address (M). Then, the Master generates the start condition. The Start condition is generated without generating the Stop condition, so it becomes the Repeated Start condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge immediately followed by the index address data on SDA. After the Master receives the data, it generates a Negative Acknowledge and the Stop condition to end the communication.

Fig. 12 CCI single read from random location

#### 3-1.2.2 CCI single read from current location

After the slave address is transmitted by a write request, that address is designated by the next communication and the index holds that value. In addition, when data read/write is performed, the index is incremented by the subsequent Acknowledge/Negative Acknowledge timing. When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after Acknowledge. After receiving the data, the Master generates a Negative Acknowledge and the Stop condition to end the communication, but the index value is incremented, so the data at the next address can be read by sending the slave address with a read request.

Fig. 13 CCI single read from current location

#### 3-1.2.3 CCI sequential read starting from random location

In reading data sequentially, which is starting from an optional address, the Master must set the index value to the start of the addresses to be read. For this purpose, dummy write operation includes the register address setting. The Master sets the sensor index value to M by designating the sensor slave address with a read request, then designating the address (M). Then, the Master generates the Repeated Start condition. Next, when the Master sends the slave address with a read request, the sensor outputs an Acknowledge followed immediately by the index address data on SDA. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop condition to end the communication.

Fig. 14 CCI sequential read starting from random location

#### 3-1.2.4 CCI sequential read starting from current location

When the index value is known to indicate the address to be read, sending the slave address with a read request allows the data to be read immediately after the Acknowledge. When the Master outputs an Acknowledge after it receives the data, the index value inside the sensor is incremented and the data at the next address is output on SDA. This allows the Master to read data sequentially. After reading the necessary data, the Master generates a Negative Acknowledge and the Stop condition to end the communication.

Fig. 15 CCI sequential read starting from current location

#### 3-1.2.5 CCI single write to random location

The Master sets the sensor index value to M by designating the sensor slave address with a write request, and designating the address (M). After that the Master can write the value in the designated register by transmitting the data to be written. After writing the necessary data, the Master generates the Stop condition to end the communication.

Fig. 16 CCI single write to random location

#### 3-1.2.6 CCI sequential write starting from random location

The Master can write a value to register address M by designating the sensor slave address with a write request, designating the address (M), and then transmitting the data to be written. After the sensor receives the write data, it outputs an Acknowledge and at the same time increments the register address, so the Master can write to the next address simply by continuing to transmit data. After the Master writes the necessary number of bytes, it generates the Stop condition to end the communication.

Fig. 17 CCI sequential write starting from random location

#### 3-1.3 2-wire serial communication block characteristics

The block operation specifications for 2-wire serial communication are show below.

Fig. 18 2-wire Serial Communication Specifications

Table. 7 2-wire Serial Communication Operation Specifications

Item	Symbol	Conditions	Min.	Max.	Unit
Low level input voltage	V <sub>IL</sub>		-0.5	0.3VDIG	V
High level input voltage	V <sub>IH</sub>		0.7VDIG	VDIG + 0.5	V
Low level output voltage	V <sub>OL</sub>	VDIG < 2 V,Sink 2 mA		0.25VDIG	V
High level output voltage	V <sub>OH</sub>	VDIG < 2 V,Sink 2 mA	0.75VDIG		V
Output fall time	t <sub>of</sub>	Load 10 pF - 400 pF,0.7VDIG $\rightarrow$ 0.3VDIG		250	ns
Input current	I	0.1VDIG -0.9VDIG	-10	10	μΑ
SDA I/O capacitance	C <sub>I/O</sub>			8	pF
SCL Input capacitance	Cı			6	pF

Table. 8 2-wire Serial Communication AC Timing

Item	Symbol	Min.	Max.	Unit
SCL clock frequency	f <sub>SCL</sub>	0	400	kHz
Rise time (SDA and SCL)	t <sub>R</sub>	fi	300	ns
Fall time (SDA and SCL)	t <sub>F</sub>	1	300	ns
Hold time (start condition)	t <sub>HDSTA</sub>	0.6	ı	μs
Setup time (repstart condition)	tsusta	0.6	ı	μs
Setup time (stop condition)	tsusто	0.6	1	μs
Data setup time	t <sub>SUDAT</sub>	100	1	ns
Data hold time	t <sub>HDDAT</sub>	0	0.9	μs
Bus free time between Stop and Start condition	t <sub>BUF</sub>	1.3		μs
Low period of the SCL clock	t <sub>LOW</sub>	1.3		μs
High period of the SCL clock	t <sub>HIGH</sub>	0.6		μs

#### 3-1.4 2-wire serial communication register map

#### 3-1.4.1 Description of 2-wire communication register map

In 2-wire serial communication, there is a 16-bit address space as follows. In IMX179, there are partially unreadable registers, which is described in Register map. If reading unreadable registers, the value to be read is 00h.

Table. 92-wire Serial Communication Register Map Address Areas

Address Area	Description
0x0000 - 0x0fff	Configuration register
0x1000 - 0x1fff	Parameter limit register Read Only and Static resister
0x2000 - 0x2fff	Reserved for Image statistics register
0x3000 - 0x5fff	Manufacture specific register

#### 3-1.5 Register Re-timing (Grouped Parameter Hold)

Register re-timing sequence is the followings;

"Registers defined as group parameter hold are re-timed in next frame start."

#### 3-2 2-wire Serial Communication Register Map (Configuration register, Parameter limit register)

#### 3-2.1 Configuration Registers – [0x0000-0x00C7]

#### 3-2.1.1 Status Registers – [0x0000-0x0016] (Read Only Dynamic Registers)

### 3-4.4 Startup Sequence in 2-wire Serial Communication Mode

Perform power-on according to the following sequence.

Fig. 19 Power-on Sequence in 2-wire Serial Communication Mode

Table. 10 Operation Specifications 2-wire Serial Communication Mode

Ī	Constraint	Label	Min.	Max.	Units	Comment
	Sequence free of VANA rising and VDIG rising	t0, t1	VANA and VDI rise in any or		ns	
	Time to REGEN Low to High after XCLR Low to High	t2		0.5	μs	
	Time to VDDL is supplied to sensor after REGEN high	t3			μs	Depending on Device
	Internal XCLR is Low to High after VDDL is supplied	t4	100	600	μs	Waking up time and init settings
7	Initializing time of silicon	t5		8825	clocks	
	D-PHY power-up	t6	1	1.1	ms	
Ī	D-PHY init	t7	100	110	μs	
	After releasing software standby to data streaming time	t8	1.5 ms + exposure time			
	Quick launch up time	t9		1	frame	stable time until optimal image quality

# 3-4.5 Power-down Sequence

Perform the power-off in the sequence shown below.

Fig. 20 Power-down Sequence in 2-wire Serial Communication

Table. 11 Operation Specifications in 2-wire Serial Communication

Constraint	Label	Min.	Max.	Units	Comment
Internal POR negedge - VANA (VDIG) fall	t1	0		ns	
Falling time of REGEN after XCLR $H \rightarrow L$	t2		0.5	μs	
Falling time of internal XCLR after XCLR $H \rightarrow L$			0.5	μs	
VANA falling – VDIG falling	t4		VDIG may	ns	
VDIG falling – VANA falling	t5			ns	

T0 in power-off sequence varies depending on the CCI communication end timing as shown below.

1. When the CCI communication is performed with Software Standby between SOF and EOF, all communicated frame data is output and the status is converted to Software Standby.

Fig. 21 Software Standby Operation Pattern 1

2. When the CCI communication is performed with Software Standby during FrameBlanking, the status is converted to Software Standby immediately after communication.

Fig. 22 Software Standby Operation Pattern 2

HANCHANG O.F.

### 4. Output Data Format

#### 4-1 CSI-2 Output Data Format

#### 4-1.1 CSI-2 Output Data Channels

The IMX179 can select the CSI-2 2 lanes or CSI-2 4 lanes serial signal output method that uses all pairs of differential signals for image data output.

#### 4-1.2 CSI-2 Frame Format

The data format of each line is based on CSI-2 General Frame Format.

The period from a line end sync code to the line start sync code for the next line is called the line blanking period. Likewise, the period from a frame end sync code to the next frame start sync code is called the frame blanking period.

Packet header consists of the following data.

Table. 12 Sync Code Settings

	Header [7:0] Description		Setting register	Remarks
	[7.0]	V. (   O	Addr: 0x3360	40 4 11 10 11
	[7:6]	Virtual Channel Identifier	CSI_channel_identifier_	See Register Section
	[5:0]	Synch Short Packet Data types	NA	,
	6'h00	Frame Start Code	NA	
	6'h01	Frame End Code	NA	
	6'h12	Embedded Data	NA	Written data in the sensor
	6'h2A	RAW8	CSI_data_format	16'h0808
	6'h2B	RAW10	CSI_data_format	16'h0A0A
MANCH	ANGO	FILMOPTICAL		

### 4-1.2.1 CSI-2 Frame Structure

The image frame structure is shown below.

Fig. 23 Frame Structure for 2Lane Serial signal output

Fig. 24 Signaling Waveform during Line Blanking Period (CSI-2)

Fig. 25 Signaling Waveform during Frame Blanking Period (CSI-2)

#### 4-1.3 CSI-2 Embedded Data Line

The value of the 2-wire serial communication configuration register can be output at the start of the frame. The output register is indicated in the "Embd DL" column of the 2-wire serial communication Register Map. The Embedded data line is output in the two lines following the sync code FS.

Fig. 26 Frame Format during Embedded Data Line Output

The output method differs according to the data format. In RAW10 mode, dummy bytes are inserted after outputting 4 bytes of data and tags.

### RAW8 (top 8 bits, 10b-8b compress) mode Simplified 2-Byte Tagged Data Format

Fig. 27 Detailed Embedded Data Line Output in RAW8 Output Mode

## RAW10 mode Simplified 2-Byte Tagged Data Format

Fig. 28 Detailed Embedded Data Line Output in RAW10 Output Mode

The end of the address and register value is determined according to the tags embedded in the data.

Table. 13 Embedded Data Line Tag

	Tag	Data Byte Description
	00h	Illegal Tag. If found treat as end of Data
	07h	End of Data (Data Byte Value = 07H)
	aah	CCI Register Index MSB [15:8]
	a5h	CCI Register Index LSB [7:0]
	5ah	Auto increment the CCI index after the data byte - valid data Data byte contains valid CCI register data
	55h	Auto increment the CCI index after the data byte - null data A CCI register does NOT exist for the current CCI index. The data byte value is the 07H
	ffh	Illegal Tag. If found treat as end of Data
NAMCH!		O.F.II.M. OPTICAL:ELECTRONIC

#### **Setting Required for Imaging** 5.

# 5-1 Pixel Array Physical Image

Pixel array physical image is shown below. It is the pixel array when upper left corner of the physical image is Pin 1. The IMX179 has vertical OB area, which cannot read out.

Fig. 29 Pixel Array Physical Image

#### 5-2 Pixel Binning Mode

MANCHANG O.F.

Binning read-out can be used to obtain an image of lower resolution for full field of view. It has advantage on frame rate than using digital scaling, and on signal-to-noise ratio than using sub-sampling. See Binning Capability Registers, for detail of available configurations.

The following diagram describes on 2x2 averaged binning operations. Pixels of two adjacent rows and columns are averaged, and read out as one output pixel.

Fig. 30 Image of 2x2 averaged Binning Mode

For explanation, represent individual pixels with its addresses in the format "color (x, y)" - for example, The Red pixel in the lower left corner is expressed as R (0, 0).

By performing 2x2 binning, R (0, 0) after binning is obtained by the following equation.

$$R(0, 0)$$
 after binning =  $({R(0, 0) + R(0, 2)}/2 + {R(2,0) + R(2,2)}/2)/2$ 

And, the total number of output pixels is reduced to 1/4 of the original pixel array.

### 5-3 Readout Position

The IMX179 default status is readout from the lower left corner when Pin 1 is located in the upper left corner. The image is inverted vertically and horizontally by the lens, so proper image output results when Pin 1 is located in the upper left corner.

Readout direction can be set by the registers.

Table. 14 Image Orientation Register

	image_orientation 0x0101 [0]	Mode						
	0	no mirror (Readout from the left with Pin 1 in the upper left corner)						
CCI	1	Horizontal Mirror (Readout from the right with Pin 1 in the upper left corner)						
register	image_orientation 0x0101 [1]	Mode						
	0	no flip (Readout from the bottom with Pin 1 in the upper left corner)						
	1	Vertical Flip (Readout from the top with Pin 1 in the upper left corner)						

Fig. 32 Output Image Diagrams for Vertical Flip and Horizontal Mirror

#### 5-4 Frame Rate Calculation Formula

Frame rate is calculated by the followings.

Frame\_Rate[f ps] = 
$$\frac{1}{\text{Time per Line[sec]} \times (\text{Frame Length})}$$

$$\label{eq:time_Per_Line} \begin{split} \text{Time\_Per\_Line[sec]} = \frac{\text{Line\_Length\_pck[pix]}}{2 \times \text{Pix\_Clock\_Freq[MHz]}} \end{split}$$

#### 5-5 Black Level Control

The IMX179 has a stable black level clamp function. The average value of the black level is adjusted to 64d. When selecting output format RAW8 (uncompressed), Black level in the table below is divided by 4.

Table. 15 Black Level

ō	Black Level (dec)
ŏ	64 (Fixed)

## 5-6 Storage Time (Electronic Shutter) Settings

#### 5-6.1 Storage Time (Electronic Shutter) Setting Registers

The storage time setting registers are shown below. The value of the register, coarse\_integration\_time, indicates the number of lines for the storage time.

The maximum storage time value is obtained by subtracting "4" from the number of lines per frame (set by coarse\_integration\_time) including the blanking period.

Table. 16 Storage Time Setting Register

gisters	Register name	Address Setting value	(dec) Remarks
CCI regi	coarse_integration_time	0x0202 0x0203 1 to frame_length_	lines-4 0x0202 = coarse_integration_time[15:8] 0x0203 = coarse_integration_time[7:0]

The value of the register, fine\_integration\_time, indicates the number of pixels for the storage time. The register, fine\_integration\_time, is a fixed value, read only register.

Table. 17 Storage Time Offset Register

	registers	Register name	Address	Setting value (dec)	Remarks
	CCI regi	fine_integration_time	0x0200 0x0201	488	RO register
6	7	9			
CiXI					
, ATO					
4					

### 5-6.2 Storage Time Calculation Method

The storage time (T<sub>SH</sub>) can be obtained from the following equation.

 $T_{SH} = (Coarse\_Inregtation\_Time \times Line\_Length\_Pck + \alpha) \times pix\_clk\_period$  Where  $\alpha$  = offset time = readdable from fine\_integration\_time register. pix\_clk\_period [s] = 1 / CK\_PIXEL. CK\_PIXEL = EXTCLK frequency  $\times$  (pll\_multiplier / pre\_pll\_clk\_div) / (vt\_sys\_clk\_div  $\times$  vt\_pix\_clk\_div)  $\times$  2.

Table. 18 Storage Time Setting (in case of Line\_Length\_PCK = 3600)

		Number of total lines	frame_length_lines [15:0]	coarse_integration_time [15:0]	Storage time (T <sub>SH</sub> )
		Dec	Dec	Dec	All-pixel scan [s]
				1	(1 x 3600 + 488) x pix_clk_period
				N	(N x 3600 + 488) x pix_clk_period
	Normal frame rate	2592	2592	:	:
				2588	(2588 x 3600 + 488) x pix_clk_period
		2593	2593	2589	(2589 x 3600 + 488) x pix_clk_period
		2594	2594	2590	(2590 x 3600 + 488) x pix_clk_period
	Low frame rate	:	:		:
	Long-time exposure	M + 4	M + 4	М	(M x 3600 + 488) x pix_clk_period
		:	71. (	:	:
		65535	65535	65531	(65531 x 3600 + 488) x pix_clk_period
AMCH	ANG O.F.I				

SONY

IMX179QQH5-C

# 5-7 Gain Settings

Analogue gain and digital gain can be set independently.

#### 5-7.1 Analogue Gain Settings

Only global analogue gain is supported. The analogue gain is set by the following equation.

Gain\_analogue = 
$$\frac{(m0 \times X + c0)}{(m1 \times X + c1)}$$

The variables are shown in the table below.

Table. 19 Gain Setting Variables

		Register name	Address	Remarks				
S	m0	analogue_gain_m0	0x008C/0x008D					
CCI registers	m1	analogue_gain_m1	0x0090/0x0091	Fixed to -1				
E E	с0	analogue_gain_c0	0x008E/0x008F	Fixed to 256				
S	c1	analogue_gain_c1	0x0092/0x0093	Fixed to 256				
	Х	analogue_gain_code_global	0x0204/0x0205	0 to 224				

Therefore, the analogue gain is as follows.

Gain\_analogue = 
$$\frac{(256)}{(256 - X)}$$

MANUCHANCO OF THE MANUCHANCE O The relationship between the setting value X (analogue\_gain\_code\_global) and the gain is shown on the following

Table. 20 Analogue Gain Setting

#### 5-7.2 Digital gain settings

The IMX179 can set the digital gain for each color. The registers required to set the digital gain are as follows.

Table. 21 Digital Gain Settings

CCI register name	Upper byte address (Setting range:1 to15)	Lower byte address (Setting range:0 to 255)
digital_gain_greenR (GR)	0x020E	0x020F
digital_gain_red (R)	0x0210	0x0211
digital_gain_blue (B)	0x0212	0x0213
digital_gain_greenB (GB)	0x0214	0x0215

Each register is comprised of 2 bytes, with the upper byte [15:8] setting the integer portion and the lower byte [7:0] setting the fractional portion of the gain. The gain for each color is obtained by the following equation.

Gain\_digital = Upper byte + 
$$\frac{\text{Lower byte}}{256}$$

The upper byte can be set to a value between 1 and 15, and the lower byte to a value between 0 and 255. Therefore, the digital gain setting range for each color is as follows.

1 + 
$$\frac{0}{256}$$
 [times](0dB)  $\leq$  Gain\_digital  $\leq$  15 +  $\frac{255}{256}$  [times](24dB)

When gain is considered in log linear scale, the adjustment steps are large at low gain and extremely small at high gain. The register values are shown on the following page in case of the gain in log linear manner in 0.1 dB steps.

### 6. On Chip Image Processing

Data flow of our "On-Chip Image Processing" is written in following figure. A/D-converted digital signal is input, and processed data is asserted from CSI-2.

Fig. 33 Data Flow Diagram

#### 6-1 Test Pattern Generator

The IMX179 can output test signals using the internal pattern generator.

#### 6-1.1 Test Pattern

The test pattern output function outputs fixed pattern image data from the IMX179. Built-in image patterns can be output by setting the necessary registers.

The registers must be set by communication to output the test pattern. There are no restrictions on the sequence for setting the registers related to test pattern output. The prescribed output is obtained by setting the necessary registers while the sensor is operating.

Table. 23 Description of Test Pattern Registers

Address	Name	Description			
0x0600		0 – no pattern (default)			
	$O_{\chi}$	1 – solid color			
0x0601	test_pattern_mode	2 – 100 % color bars			
0x0001		3 – fade to grey color bars			
		4 - PN9			
0x0602	toot data rad	The test data used to replace red pixel data			
0x0603	test_data_red	The test data used to replace red pixel data			
0x0604	toet data groonP	The test data used to replace green pixel data on rows that also			
0x0605	test_data_greenR	have red pixels			
0x0606	test data blue	The test data used to replace blue pixel data			
0x0607	test_uata_blue	The test data used to replace blue pixel data			
0x0608	tost data groonP	The test data used to replace green pixel data on rows that also			
0x0609	test_data_greenB	have blue pixels			
0x060A	horizontal cursor width	Defines the width of the horizontal cursor (in pivals)			
0x060B	nonzontal_cursor_width	Defines the width of the horizontal cursor (in pixels)			

SON	Y		IMX179QQH5-C
A	Address	Name	Description
	0x060C 0x060D	horizontal_cursor_position	Defines the top edge of the horizontal cursor
<del> </del>	0x060E 0x060F	vertical_cursor_width	Defines the width of the vertical cursor (in pixels)
	0x0610 0x0611	vertical_cursor_position	Defines the left hand edge of the vertical cursor.  A value of 0xFFFFswitches the vertical cursor into automatic mode where it automatically advances every frame.

# 6-1.1.1 Pattern Description

Table. 24 Description of Test Patterns

PN9 is generated by the generator polynomial of  $X^9 + X^5 + 1$  as the initial value = 1

#### 6-2 Digital Gain Setting

See section 5-7.2 Digital gain settings.

#### 6-3 Black Level Adjust

The register required to set the Black Level Adjust is as follows.

Table. 25 Black Level Adjust Setting Register

Index	Bit	Pagistar Nama	RW	Commant	Re-Timed	Default
(HEX)	DIL	Register Name	KVV	Comment	Re-Timea	(HEX)
300B	[7:0]	BLKLEVEL	RW	Set Black Level		40
30E5	[11]	Blklevel_set (testdi[11])	RW	Defines pedestal level. 0: pedestal = 0x40 (fixed) 1: pedestal = BLKLEVEL		

#### 6-4 Defect Correction

The registers required to set the Defect Correction are as follows. 3 different functions are implemented;

- 1. Dynamic single defect pixel correction
- 2. Static same color adjoin pixel correction
- 3. Static 2x4 defect pixel correction

Dynamic single defect pixel correction

The available is only the Dynamic Mode-1. The Dynamic Mode-2 and Dynamic Mode-3 can not be used.

Static same color adjoin pixel correction and Static 2x4 defect pixel correction

Static defect addresses for mapped\_couplet\_correct (couplet defect: two adjacent defect pixels of the same color) are stored in NVM, and sensor processes them in itself.

Their address information of static defect correction is written on NVM at Sony factory. Customers can not be set at an additional on NVM.

Table. 26 Defect Correction Setting Registers

Index (HEX)	Bit	Register Name	RW	Comment
4100	[7:0]	ZNR	RW	[2]: Static Mode 1: ON (Must be set 1) [3]: Dynamic Mode-1 0: OFF 1:ON [4]: Dynamic Mode-2 0: OFF (Must be set 0) [5]: Dynamic Mode-3 0: OFF (Must be set 0)

# 7. NVM Memory Map

# 7-1 Block Diagram

Fig. 34 Block Diagram

NVM is composed of 16 pages (from 0 to 15) and 64 bytes per page. ECC is also applied for every 16 address (bytes), 4 rows in 1 page.

Fig. 35 NVM Map structure

### 7-2 NVM Functions

NVM block has following functions.

Table. 29 Functions via NVM

	No	Item	Description
	1	Data Interface	User can write/read data via CCI by the unit of page
	2	Writing Reg. Value	Writing assigned address and values which are transferred into the assigned registers.
	3	Writing Defect address	Writing assigned address, whose values are used for defect corrections
X	4	Reading	Reading NVM data by the unit of page, not ECC region
	5	ECC Function	Can apply ECC for each 16 bytes (1-row) block. 1-bit per 16 bytes can be corrected.
	6	ECC status	Can check while reading/writing that ECC is applied by page.  1. Read data is correct. No ECC is applied.  2. Read data is correct with 1-bit correction of ECC.  3. Read data is incorrect though ECC is applied (means >2 bits per a unit of 16-byte (row) are incorrect).

# 7-3 Related Registers

Registers to be related about NVM are the followings.

Table. 30 Related Registers

Index Byte		Register Name	RW	Comment	Re-Time	Default	Embd	Comments
IIIuex	Dyte	Register Name	IXVV	Comment	NG-TIME	(HEX)	DL	Comments

3368	[15:8]	INCK_FREQ[15:8]	RW	input_clk_frequency_mhz		0B		
3369	[7:0]	INCK_FREQ[7:0]	RW	(need input)		6E		
3382	[15:8]	SYSOTP_IF_WRCNT[15:8]	RW	OTP write clock setting		07		
3383	[7:0]	SYSOTP_IF_WRCNT[7:0]	RW	Write Glock Setting		80		
3400	[2:0]	OTPIF_CTRL	RW	OTP I/F control register [0] enable [1]R/W [2]error clear		00		
3401	[1:0]	OTPIF_STATUS	RO-D	OTP I/F status; [0] ready [1] error		00		
3402	[2:0]	OTPIF_PAGE_SELECT	RW	otpif_page_select		00		
3404	[7:0]	OTPIF_DT_0	RW	otpif_data_0		00		
(DT_1 t	to DT_62	2						
3443	[7:0]	OTPIF_DT_63	RW	otpif_data_63		00		Trigger to start write sequence
5801	[5:4]		RO	00: No data error exists. 01: Data error and corrected by ECC. = Read data is correct. 11: Data error exists, and cannot be corrected by ECC. Read data is incorrect.		00		

Before writing / reading following steps are required

- 0. Set Sensor being SW-Standby by 0x0100 = 0h
- 1. Set monitor output to check writing pulse. (option, debug purpose only)
- 2. Set OTP write clock setting.

(When INCK = 9 MHz, 021Ch at 0x3382, 0x3383)

3. Set clock frequency that user supplies to the sensor.

(When INCK = 9 MHz, 0900h at 0x3368, 0x3369)

#### Then when writing:

- 1. Set controller "ECC ON" or ECC OFF" by 0x3380 = "20h" (ECC ON) or "28h" (ECC OFF)
- 2. Set Write by 0x3400 = "3h."
- 3. Set page from 0 to 12 by 0x3402.
- 4. Set 0x3404 to 0x3443 OTPIF\_DT\_0to 63 = xxh (Data to Write) \*1
- 5. Set again OTPIF\_DT\_63 with the same value that one sets in previous section. (4)

#### Then when reading;

HANCHANG O.F.III.MOP

- 1. Set controller "ECC ON" or "ECC OFF" by 0x3380 = 00h (ECC ON), 08h (ECC OFF)
- 2. Set Read by 0x3400 = "1h."
- 3. Set page from 0 to 12 by 0x3402.
- 4. Set 0x3404 to 0x3443 OTPIF\_DT\_0to 63 = xxh (Data to Write)

\*1 Since OTP write data are once stored into "Buffer memory", whole page data including no-write data = "0x00" must be set via CCI to calculate error correction codes. And if there are any written pages with ECC\_OFF, same date value must be written. When final writing, it should be written with ECC\_ON.

#### 7-4 Manuals

Due to ECC applied to NVM data, following steps are required during writing and reading.

### 7-4.1 Writing Sequence

1st step is Initial read check to sort out initial failure

Fig. 36 Flow chart for initial Reading

HANCHANG O.F.III.MOP

Fig. 37 Flow chart for Multi step Writing

After this check, write sequence can start as followings.

Table. 31 Example of multi-step writing in the page w/ ECC function

Page	Addr	1st	2nd		The Last
Х	000	Α			Α
Х	001		В		В
Х					
Х	015			С	С
Х	016			D	D
Х					
Х	063			Е	E
0x33	28h	28h	28h	20h	

The table shows example of multi-step writing in one page w/ ECC function. Integrators need to turn on ECC at the last writing to secure NVM writing.

## 7-4.2 Reading Sequence

When reading NVM, ECC ON/OFF needs to be matched in the last writing. Followings are the example settings.

ECC OFF; 0x3380 = 08h ECC ON; 0x3380 = 00h

White pixels in the dark	405 LSB ≤ D	for each color plane	SPS_2	18 dB gain
3 or more same color adjoin at high light	19 % <  D			
3 or more same color adjoin at dark	405 LSB ≤ D	0		18 dB gain

<sup>(\*1)</sup> These defects will be corrected by internal static defect correction.

Note1) D...Spot pixel level.

WANCHANG O.F.III.M. O.F.

Note2) The above chart (hereinafter referred to as the "White and Black Pixel Specifications") is the standard only for sorting CMOS image sensor products in this specification book (hereinafter referred to as the "PRODUCTS") before shipment from a manufacturing factory. Sony Corporation and its distributors (collectively hereinafter referred to as the "Seller") disclaim and will not assume any liability even if actual number of distorted pixels of the PRODUCTS delivered to you exceeds the maximum number set forth in the White and Black Pixel Specifications. You are solely liable for any claim, damage or liability arising from or in connection with such distorted pixels. If the Seller separately has its own product warranty program for the PRODUCTS (the "Program"), the conditions in this specification book shall prevail over the Program and the Seller shall not assume any liability under the Program to the extent there is contradiction.

## 10-4 Zone Definition

Fig. 41 Zone Definition Diagram

## 10-5 Image Sensor Characteristics and Spot Pixel Measurement Method

#### 10-5.1 Measurement conditions

The device drive conditions are at the typical values of the bias and clock voltage conditions.

Table. 40 Measurement Conditions

Supply voltage	Analogue 2.7 V, digital 1.2 V, IF 1.8 V
Clock	INCK 9 MHz

In the following measurements, spot pixels are excluded and, unless otherwise specified, the optical black (OB) level is used as the reference for the signal output, which is taken as the value of the Gr/Gb signal output or the R/B signal output of the measurement system.

## 10-5.2 Color coding of this image sensor & Readout

The primary color filters of this image sensor are arranged in the layout shown in the figure below. Gr and Gb denote the G signals on the same line as the R signal and the B signal, respectively. The R signal and Gr signal lines and the Gb signal and B signal lines are output successively.

All pixel signals are output successively in a 1/15 s period.

Fig. 42 Color Coding Diagram

## 10-5.3 Definition of standard imaging conditions

#### 10-5.3.1 Standard imaging condition I

Use a pattern box (luminance:  $706 \text{ cd/m}^2$ , color temperature of 3200 K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0 mm) as an IR cut filter and image at F2.8. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

## 10-5.3.2 Standard imaging condition II

A testing lens with CM500S (t = 1.0 mm) is used as an IR cut filter for light source with 3200 K color temperature. The luminous intensity to the sensor receiving surface is adjusted to the luminous intensity level shown in each measurement item by the light source output, lens aperture or storage time control by the electronic shutter.

## 10-5.3.3 Standard imaging condition III

IA testing lens with CM500S (t = 1.0 mm) is used as an IR cut filter for light source with 3200 K color temperature. The luminous intensity to the sensor receiving surface is adjusted to the luminous intensity level shown in each measurement item by the light source output or storage time control by the electronic shutter.

## Image sensor characteristics measurement method

#### ISC\_1. Sensitivity

Set the measurement condition to the standard imaging condition I. After setting the electronic shutter mode with a shutter speed of 1/120 s, measure the Gr and Gb signal outputs (VGr, VGb) at the center of the screen, and substitute the values into the following formula.

$$S = \frac{VGr + VGb}{2} [LSB]$$

#### ISC\_2. Sensitivity ratio

Set the measurement condition to the standard imaging condition II. After adjusting so that the average value of the VG signal output is 430[LSB], measure the R signal output (VR [LSB]), the Gr and Gb signal outputs (VGr, VGb [LSB]) and the B signal output (VB [LSB]) at the center of the screen in frame readout mode, and substitute the values into the following formulas.

$$VG = \frac{VGr + VGb}{2}$$

$$RG = \frac{VR}{VG}$$

$$RB = \frac{VB}{VG}$$

## ISC\_3. Saturation signal

Set the measurement condition to the standard imaging condition III. After adjusting the luminous intensity to 20 times the intensity with the average value of the G signal output, 430[LSB], measure the average value of the Gr, Gb, R and B signal outputs.

# ISC\_4. Dark signal

Measure the average value (Vdt[LSB]) of the signal output in zone2D in the light-obstructed state. Define the average value of the signal output accumulated in 1 frame period (tlv) as Vdt1V and the average value

of the signal output accumulated in the shortest period (1H period: tlh) as Vdt1H, and then substitute the values into the following formula.

#### 10-5.4 Notice on White Pixels Specifications

After delivery inspection of CMOS image sensors, cosmic radiation may distort pixels of CMOS image sensors, and then distorted pixels may cause white point effects in dark signals in picture images. (Such white point effects shall be hereinafter referred to as "White Pixels".) Unfortunately, it is not possible with current scientific technology for CMOS image sensors to prevent such White Pixels. It is recommended that when you use CMOS image sensors, you should consider taking measures against such White Pixels, such as adoption of automatic compensation systems for White Pixels in dark signals and establishment of quality assurance standards. Unless the Seller's liability for White Pixels is otherwise set forth in an agreement between you and the Seller, Sony Corporation or its distributors (hereinafter collectively referred to as the "Seller") will, at the Seller's expense, replace such CMOS image sensors, in the event the CMOS image sensors delivered by the Seller are found to be to the Seller's satisfaction, to have over the allowable range of White Pixels as set forth as set forth above under the heading "Spot Pixels Specifications", within the period of three months after the delivery date of such CMOS image sensors from the Seller to you; provided that the Seller disclaims and will not assume any liability after if you have incorporated such CMOS image sensors into other products. Please be aware that Seller disclaims and will not assume any liability for (1) CMOS image sensors fabricated, altered or modified after delivery to you, (2) CMOS image sensors incorporated into other products, (3) CMOS image sensors shipped to a third party in any form whatsoever, or (4) CMOS image sensors delivered to you over three months ago. Except the above mentioned replacement by Seller, neither Sony Corporation nor its distributors will assume any liability for White Pixels. Please resolve any problem or trouble arising from or in connection with White Pixels at your costs and expenses.

#### [For Your Reference] The Annual Number of White Pixels Occurrence

The chart below shows the predictable data on the annual number of White Pixels occurrence in a single-story building in Tokyo at an altitude of 0 meters. It is recommended that you should consider taking measures against the annual White Pixels, such as adoption of automatic compensation systems appropriate for each annual number of White Pixels occurrence.

The data in the chart is based on records of past field tests, and signifies estimated number of White Pixels calculated according to structures and electrical properties of each device. Moreover, the data in the chart is for your reference purpose only, and is not to be used as part of any CMOS image sensor specifications.

#### **Example of Annual Number of Occurrence**

White Pixel Level (in case of storage time = 1/30 s) $(T_j = 60 \degree C)$	Annual number of occurrence		
16 LSB or higher	1.7 pcs		
29 LSB or higher	1.1 pcs		
71 LSB or higher	0.6 pcs		
147 LSB or higher	0.3 pcs		
212 LSB or higher	0.3 pcs		

- Note 1) The above data indicates the number of White Pixels occurrence when a CMOS image sensor is left for a year.
- Note 2) The annual number of White Pixels occurrence fluctuates depending on the CMOS image sensor storage environment (such as altitude, geomagnetic latitude and building structure), time (solar activity effects) and so on. Moreover, there may be statistic errors. Please take notice and understand that this is an example of test data with experiments that have being conducted over a specific time period and in a specific environment.
- Note 3) This data does not guarantee the upper limits of the number of White Pixels occurrence.

## For Your Reference:

The annual number of White Pixels occurrence at an altitude of 3,000 meters is from 5 to 10 times more than that at an altitude of 0 meters because of the density of the cosmic rays. In addition, in high latitude geographical areas such as London and New York, the density of cosmic rays increases due to a difference in the geomagnetic density, so the annual number of White Pixels occurrence in such areas approximately doubles when compared with that in Tokyo.

IMX179QQH5-C SONY

#### 10-5.5 **Measurement Method for Spot Pixels**

Measure under the standard imaging condition II.

## Black or white pixels at high light

After adjusting the average value of the Gr/Gb signal output to 430[LSB], measure the local dip point (black pixel at high light, VxB) and peak point (white pixel at high light, VxK) in the Gr/Gb/R/B signal output Vx (x = Gr/Gb/R/B), and substitute the values into the following formula.

$$D_{K}$$
(WhitePixellevel) =  $\frac{\overline{V_{xK}}}{\overline{V_{x}}} \times 100[\%]$ 

$$D_B(Blackpixelleve) = \frac{\overline{V_{xB}}}{\overline{V_x}} \times 100[\%]$$

Fig. 43 Measurement Method for Spot Pixels

#### SPS 2. White pixels in the dark

Set the device to a dark setting and measure the local peak point of the signal output waveform using the average value of the dark signal output as a reference.

# 12. Connection Example

Fig. 45 Recommended Circuit

Note) When fixing the voltage of chip back side, fix it to VDDSUBD voltage

## 13. Notes on Handling

#### 1. Static charge prevention

Image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- (1) Either handle bare handed or use non-chargeable gloves, clothes or material. Also use conductive shoes.
- (2) Use a wrist strap when handling directly.
- (3) Install grounded conductive mats on the floor and working table to prevent the generation of static electricity.
- (4) Ionized air is recommended for discharge when handling image sensors.
- (5) For the shipment of mounted boards, use boxes treated for the prevention of static charges.

#### 2. Protection from dust and dirt

- (1) Perform all work in a clean environment.
- (2) Do not touch the chip surface with hand and make any object contact with it.
- (3) Keep in a dedicated case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.

#### 3. Others

JANCHANG OFFILM

- (1) Do not expose to strong light (sun rays) for long periods, as the color filters of color devices will be discolored.
- (2) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or use in such conditions.
- (3) This product is precision optical parts, so care should be taken not to apply excessive mechanical shocks or force.
- (4) Reliability assurance of this product should be ignored because it is a bare chip.
- (5) Note that imaging characteristics of the sensor may be affected when approaching strong electromagnetic wave or magnetic field during operation.
- (6) Note that X-ray inspection may damage characteristics of the sensor.
- (7) Note that the sensor may be damaged when using ultraviolet ray and infrared laser for mounting it.
- (8) Note that image may be affected by the light leaked to optical black when using an infrared cut filter that has transparency in near infrared ray area during shooting subjects with high luminance.
